Ultra-Poor Graduation and Environmental Shocks: Evidence from the 2019 Malawian Floods

Tara Bedi

with Michael King, Ilan Noy and Julia Vaillant
(TIME, Trinity College Dublin, Victoria University of Wellington and the World Bank)

December 6, 2022
Overview/Motivation

1. Growing evidence multifaceted anti-poverty programmes for ultra poor (Graduation) are effective.

2. Climate change, natural disasters, other shocks may undermine the ability of participants to graduate from poverty, and sustain gains.

3. Natural disaster occurred during implementation of graduation intervention.

4. Unique circumstances to study:
   - How natural disaster affects the household’s ability to cope with such shocks
Substantial negative effects on HH consumption, income, and durable assets, with greater effects for poorer HHs ((Carter et al. (2007), (Antilla-Hughes and Hsiang (2012) and (Baez et al. (2016)). Studies find poorer HH dis-invest in health/education to smooth food consumption (long term damage).

Without complete insurance, environmental risks may undermine hard won improvements in livelihoods.
Households who received top-up cash transfers post Tropical Cyclone Winston, were more likely to report faster financial recovery (Ivaschenko et al. (2019)).

In Zambia, cash transfers were found to have a mitigating role against the negative effects of weather shocks (Asfaw et al. (2017)).

Each additional year of exposure to cash transfers post a rainfall shock in birth year increases probability of employment at age 18 by 8 per-cent (Adhvaryu et al. (2018)).
Research Questions

1. How does a natural disaster affect Graduation households’ food security?

2. Do multifaceted anti-poverty programmes protect households from impacts of natural disasters?

3. What mechanisms play a role in influencing the trajectory of participating HHs pre- and post flood? Examine role played by:
   - Loss of productive resources
   - Relief
   - Psychological bandwidth

Contribution to the Literature

- Adds evidence of how multi faced anti-poverty programmes for the Ultra Poor protect households from real shocks/environmental disasters.
- Able to understand the impacts of these shocks over time.
3. Context - Cyclone Idai

- IPCC identify Malawi as high-risk country for climate change.
  - Malawi has experienced 19 major floods and 7 droughts in the last 50 years.
- Hit Southern/Central regions of Malawi twice in March 2019 affecting 1m people, displacing 86,976, killing 60, and destroying or damaging 300,000 houses (Government of Malawi, 2019).
Figure: The Path of Cyclone Idai

CYCLONE AND FLOOD AFFECTED AREAS

  - Affected
  - Hardest hit

- Towns
- Rivers
- Lakes
The graduation programme is a “big-push” intervention designed to move people out of poverty by simultaneously boosting livelihoods, income, and access to financial services.

Our overall study aims to better understand the gender dimensions of the programme by randomising the gender of the recipient and testing the impact of an additional couples training intervention.

This study uses the randomisation of the roll out of the programme to understand how the households cope with shocks.

Cyclone Idai hit during year one (for cohort one) of the implementation of Concern’s graduation model.
The study covers 200 villages, stratified across Mangochi and Nsanje districts, and covers a total of 2563 couples.

- Eligible households selected via community wealth ranking, or proxy means test based on household materials and livestock assets.

All 200 sample villages randomly allocated to Research Cohorts 1 or 2

- Cohort 1 treated villages began the Graduation program in 2018
- Cohort 2 treated villages only informed and started the Graduation programme in 2019
We have two related measures of Food Security.

- **Annual Food Security Index**: 9 components, ranges from 0 (severely food insecure) to 9 (food secure).
- **Recent Food Security Index**: 3 components, ranges from 0 (severely food insecure) to 3 (food secure).
Key Outcome Variable 2 - Bandwidth

Low bandwidth, perhaps due to poverty, leads to poorer strategic longer term decisions (Mani et al. (2013)).

- **BW Index**: mean of the four standardized variables.
  - BW1: Average (over 10 tries) reaction time touching a randomly appearing figure on tablet.
  - BW2: Inhibitory control measured by hearts and flowers test.
  - BW3: Recite number back after 10 seconds. If correct given increasingly longer numbers.
  - BW4: Fluid intelligence through a raven’s test.
Methodology

Estimation Equation

\[ Y_{(i)hv} = \beta_1 + \beta_2 T_{hv} + \beta_3 T_{hv} \times F_{hv} + \beta_4 F_{hv} + \beta_6 X(i)_{hv} + \beta_6 Z(i)_{hv} + \epsilon_{hv} \]

- \( \beta_2 \) captures the impact of our treatment indicator \( T_{hv} \), which takes the value of 1 if household \( h \) in village \( v \) received the Graduation program, and 0 if it did not.
- \( \beta_3 \) captures the interaction term between being over the damage threshold and being on the Graduation program.
- \( \beta_4 \) captures the impact of being over the damage threshold in 2019.
- We also include time variant \( (X(i)_{hv}) \) and time invariant \( (Z(i)_{hv}) \) household and individual controls from baseline.
- \( \epsilon_{hv} \) is our statistical error term, clustered at the level of randomisation.
82% of the full sample reported being affected by the flood, with 86% of non-treated households reported being affected compared to 76%.

When we measure the intensity of damage, we find no statistical difference between Graduation and non-Graduation households.

Relief efforts began in March, with considerable international attention.

NGOs (international/local), the Government and the UN all engaged in relief efforts. International NGOs playing the biggest role.

Relief efforts often went through village head to decipher who in village would receive aid.

Efforts made to give aid to HHs not already in anti-poverty programmes.

Bandwidth Findings

- Strong evidence that Graduation improved bandwidth.
- And that flooding also increased bandwidth.

Conclusions

- Graduation households above the damage threshold have smaller food security gains than Graduation households under the damage threshold.
- Flooding effect for treated households was greater than for non-treated households.
- Potential mechanisms for this negative impact are greater losses for graduation households related to harvest and relief targeting strategies.
- Local decision-making structures use equity/fairness as a consideration in relief allocations.
- These negative impacts for Graduation households above the damage threshold linger for another year, but two years post flooding no difference between treated households above and under the damage threshold.
